The image shows two separate ontology editors side-by-side, both titled "OntologyID(Anonymous-6)".

Left Editor (Pharmacy Ontology):

- Annotations:** A tooltip for "Place" defines it as "Entity describing a chemist or drug store".
- Description: Pharmacy**
 - Equivalent To:** `spinningheels:has_facilizing`, `Place`.
 - SubClass Of (Anonymous Ancestor):** `spinningheels:Facilizing`, `GeoCoordinate`.
 - Instances:** `BarberShop`, `Church`, `ConvenienceStore`, `GroceryStore`, `Hospital`, `Library`, `Museum`, `MovieTheater`, `NaturalBuildingWall`, `Park`, `PerfumeShop`, `PoliceStation`, `PostOffice`, `Pub`, `RailwayStation`, `Shakes`, `Spa`, `SportsActivityLocation`, `TrainStation`, `Bar&Pub`, `PerformingArtsTheater`, `ParkingFacility`, `BikeSharingStand`, `Hospital`, `School`.
 - Target for Key:** `disjointWith`.
 - Disjoint With:** `NaturalBuildingWall`, `Park`, `PerfumeShop`, `PostOffice`, `Pub`, `RailwayStation`, `Shakes`, `Spa`, `SportsActivityLocation`, `TrainStation`, `Bar&Pub`, `PerformingArtsTheater`, `ParkingFacility`, `BikeSharingStand`, `Hospital`, `School`.
 - Disjoint Union Of:**

Right Editor (Drugstore Ontology):

- Annotations:** A tooltip for "Drugstore" defines it as "entity selling drugs".
- Description: Drugstore_GD-17637**
 - Equivalent To:** `Locater_GD-122`.
 - SubClass Of (Anonymous Ancestor):** `Locater_GD-122`.
 - Instances:** `Bar`, `Bank`, `BusStop`, `CarPark`, `Church`, `ConvenienceStore`, `GroceryStore`, `Hospital`, `Library`, `Museum`, `MovieTheater`, `NaturalBuildingWall`, `OfficeBuilding`, `PostOffice`, `PoliceStation`, `RailwayStation`, `Shakes`, `Spa`, `SportsActivityLocation`, `TrainStation`, `Bar&Pub`, `PerformingArtsTheater`, `ParkingFacility`, `BikeSharingStand`, `Hospital`, `School`.
 - Target for Key:** `disjointWith`.
 - Disjoint With:** `Bar`, `Bank`, `BusStop`, `CarPark`, `Church`, `ConvenienceStore`, `GroceryStore`, `Hospital`, `Library`, `Museum`, `MovieTheater`, `NaturalBuildingWall`, `OfficeBuilding`, `PostOffice`, `PoliceStation`, `RailwayStation`, `Shakes`, `Spa`, `SportsActivityLocation`, `TrainStation`, `Bar&Pub`, `PerformingArtsTheater`, `ParkingFacility`, `BikeSharingStand`, `Hospital`, `School`.
 - Disjoint Union Of:**

5 Conclusions

Data description

32 datasets representing all the etypes, coming from:

- **Openstreetmap**, extracted thanks to *overpass-turbo.eu*
- **DataTrentino**
- **webscraping**

All the data are in `json` format and stored in this [Data folder](#)

Metadata documentations is stored in [this folder](#) (DCAT standard).

Meaning of attributes are examined in depth in the files stored in [this folder](#).

Data description

An other important aspect was the collaboration with other 2 groups, Tourism facilities and Transportation. They provided us 4 datasets:

- **Trails**
- **Bus stops and stop times**
- **Ski Resort**, which has been merged later with **Ski Area**

Also to these Dataset the operations which later we are going to mention have been applied.

Data description

Main operations applied on datasets are:

- filtered (applied in order to remove sparse attributes and aligning to the ontology) with script that are stored in this [folder](#)
- separation of datasets (e.g *Point of Interest*, from which information about single etypes have been extracted)
- separation of attributes (e.g. address)
- small manual operations have been applied.

Other operations have been carried out in order to provide effective relationship between Etypes and can be found [here](#). These script were applied to *Ski Area*, *Ski Slopes*, *Railway* and *Railway Stations*.

5 Conclusions

DKG description

The tool used to align data to reference ontology is **KarmaLinker**. All the datasets has been imported in KarmaLinker, where the manual linking of new data sources has been performed.

We obtain for each dataset 3 types of data: the model, the `RDF` and the `EML`. These data are all stored in this [folder](#).

To visualize the graph we used the `GraphViz` tool and installing the python library `rdflib`.

The results obtained are stored [here](#).

The queries have been performed thanks to the `GraphDatabase` `GraphDB`, importing our `RDFs` and using the query language `SPARQL` to have the following [queries](#).

DKG description

CQ: Luciano and Corrado, 4.8

- Which and where are the hospitals in Trentino?

The screenshot shows a SPARQL query interface with the following details:

- Query Editor:** The query is named "CQ_Luciana_4_10". It uses PREFIX declarations for `etype`, `xsd`, and `rdf`. The query selects `?hospital_name`, `?longitude`, and `?latitude`, and filters for hospital names starting with "Pronto Soccorso" and specific hospital IDs.
- Result Table:** The results are displayed in a table with columns: `hospital_name`, `longitude`, and `latitude`. There are 7 rows of data.
- Table Headers:** The table has headers for `Table`, `Raw Response`, `Pivot Table`, `Google Chart`, and `Download as`.
- Filter:** A filter box at the bottom left contains the text "Filter query results".
- Message:** A message at the bottom right says "Showing results from 1 to 34 of 34. Query took 0.1s, moments ago."

	hospital_name	longitude	latitude
1	"Casa di Cura "Villa Bianca"	"11.12668658333333"	"46.06253391666666"
2	"Pronto Soccorso Ospedale Santa Maria del Carmine"	"11.0401616"	"45.8811734"
